[What is This?](#)

the work-home crunch

The decade-long debate over whether Americans are working longer hours is misleading. Indeed, while well-educated professionals are working more hours than they used to, others with less education are working fewer. And the people under the most pressure are not just overburdened at work. Increasingly, these single parents and two-income couples find themselves in a time squeeze between home and work.

Three businessmen in San Francisco's financial district walk briskly to lunch. More than one-third of male managers and professionals now work 50 hours or more per week, a substantial increase since 1970.

More than a decade has passed since the release of *The Overworked American*, a prominent 1991 book about the decline in Americans' leisure time, and the work pace in the United States only seems to have increased. From sleep-deprived parents to professionals who believe they must put in long hours to succeed at the office, the demands of work are colliding with family responsibilities and placing a tremendous time squeeze on many Americans.

Yet beyond the apparent growth in the time that many Americans spend on the job lies a more complex story. While many Americans are working more than ever, many others are working less. What is more, finding a balance between work

and other obligations seems increasingly elusive to many workers—whether or not they are actually putting in more time at work than workers in earlier generations. The increase in hurried workers and hurried families is a problem that demands solutions. But before we can resolve this increasingly difficult time squeeze we must first understand its root causes.

average working time and beyond

"There aren't enough hours in the day" is an increasingly resonant refrain. To most observers, including many experts, the main culprit appears to be overwork—our jobs just take

Chinese-Cambodian restaurant owners. Immigrants traditionally employ family members in small businesses, but now many Americans live in families where all the adults work.

up too much of our time. Yet it is not clear that the average American is spending more time on the job. Although it may come as a surprise to those who feel overstressed, the average work week—that is, hours spent working for pay by the average employee—has hardly changed over the past 30 years. Census Bureau interviews show, for example, that the average male worked 43.5 hours a week in 1970 and 43.1 hours a week in 2000, while the average female worked 37.1 hours in 1970 and 37.0 hours in 2000.

Why, then, do more and more Americans feel so pressed for time? The answer is that averages can be misleading. Looking only at the average experience of American workers misses key parts of the story. From the perspective of individual workers, it turns out some Americans are working more than ever, while others are finding it harder to get as much work as they need or would like. To complicate matters further, American families are now more diverse than they were in the middle of the 20th century, when male-breadwinner households predominated. Many more Americans now live in dual-earner or single-parent families where all the adults work.

These two trends—the growing split of the labor force and the transformation of family life—lie at the heart of the new time dilemmas facing an increasing number of Americans. But they have not affected all workers and all families in the same way. Instead, these changes have divided Americans into those who feel squeezed between their work and the rest of their life, and those who have more time away from work than they need or would like. No one trend fits both groups.

So, who are the time-squeezed, and how do they differ from those with fewer time pressures but who may also have less work than they may want or need? To distinguish and describe the two sets of Americans, we need to look at the experiences of both individual workers and whole families. A focus on workers shows that they are increasingly divided between those who put in very long work weeks and who are concentrated in the better-paying jobs, and those who put in comparatively short work weeks, who are more likely to have fewer educational credentials and are more likely to be concentrated in the lower-paying jobs.

But the experiences of individuals does not tell the whole story. When we shift our focus to the family, it becomes clear

that time squeezes are linked to the total working hours of family members in households. For this reason, two-job families and single parents face heightened challenges. Moreover, women continue to assume the lion's share of home and child care responsibilities and are thus especially likely to be squeezed for time. Changes in jobs and changes in families are putting overworked Americans and underemployed Americans on distinct paths, are separating the two-earner and single-parent households from the more traditional households, and are creating different futures for parents (especially mothers) than for workers without children at home. (On the issue of which specific schedules people work and the consequences of nonstandard shifts, see "The Economy that Never Sleeps," *Contexts*, Spring 2004.)

a growing divide in individual working time

In 1970, almost half of all employed men and women reported working 40 hours a week. By 2000, just 2 in 5 worked these "average" hours. Instead, workers are now far more likely to put in either very long or fairly short work weeks. The share of working men putting in 50 hours or more rose from 21 percent in 1970 to almost 27 percent in 2000, while

the share of working women putting in these long work weeks rose from 5 to 11 percent.

At the other end of the spectrum, more workers are also putting in shorter weeks. In 1970, for example, 5 percent of men were employed for 30 or fewer hours a week, while 9 percent worked these shortened weeks in 2000. The share of employed women spending 30 or fewer hours on the job also climbed from 16 percent to 20 percent (see figure 1) In total, 13 million Americans in 2000 worked either shorter or longer work weeks than they would have if the 1970s pattern had continued.

These changes in working time are not evenly distributed across occupations. Instead, they are strongly related to the kinds of jobs people hold. Managers and professionals, as one might expect, tend to put in the longest work weeks. More than 1 in 3 men in this category now work 50 hours or more per week, compared to only 1 in 5 for men in other occupations. For women, 1 in 6 professionals and managers work these long weeks, compared to fewer than 1 in 14 for women in all other occupations. And because jobs are closely linked to education, the gap in working time between the college educated and those with fewer educational credentials has also grown since 1970.

figure 1: the percentage of men and women who put in 30 or fewer hours and who put in 50 or more hours a week in 1970 and 2000

Thus, time at work is growing most among those Americans who are most likely to read articles and buy books about overwork in America. They may not be typical, but they are indeed working more than their peers in earlier generations. If leisure time once signaled an elite lifestyle, that no longer appears to be the case. Working relatively few hours is now more likely to be concentrated among those with less education and less elite jobs.

Workers do not necessarily prefer these new schedules. On the contrary, when workers are asked about their ideal amount of time at work, a very different picture emerges. For example, in a 1997 survey of workers conducted by the Families and Work Institute, 60 percent of both men and women responded that they would like to work less while 19 percent of men and women said that they would like to work more. Most workers—both women and men—aspire to work between 30 and 40 hours per week. Men generally express a desire to work about 38 hours a week while women would like to work about 32 hours. The small difference in the ideal working time of men and women is less significant than the shared preferences among them. However, whether their jobs require very long or comparatively short work weeks, this

shared ideal does stand in sharp contrast to their job realities. As some workers are pressured to put in more time at work and others less, finding the right balance between work and the rest of life has become increasingly elusive.

overworked individuals or overworked families?

Fundamental shifts in family life exacerbate this growing division between the over- and under-worked. While most analyses of working time focus on individual workers, time squeezes are typically experienced by families, not isolated individuals. A 60-hour work week for a father means something different depending on whether the mother stays at home or also works a 60-hour week. Even a 40-hour work week can seem too long if both members of a married couple are juggling job demands with family responsibilities. And when a family depends on a single parent, the conflicts between home and work can be even greater. Even if the length of the work week had not changed at all, the rise of families that depend on either two incomes or one parent would suffice to explain why Americans feel so pressed for time.

Photo by Stephen Voss

Most workers with short workweeks are in the worst-paying jobs and many would prefer to work more often. These day laborers in Portland, Oregon spend many hours every day flagging down cars to find employers, but very few find work more than three or four days a week.

figure 2: total hours of work per week for married couples, 1970 and 2000

Source: March Current Population Surveys; nonfarm married couples aged 18-64

To understand how families experience time squeezes, we need to look at the combined working time of all family members. For example, how do married couples with two earners compare with those anchored by a sole, typically male, breadwinner? For all married couples, the work week has indeed increased from an average of about 53 hours in 1970 to 63 hours in 2000. Given that the average work week for individuals did not change, it may seem strange that the couples' family total grew so markedly. The explanation for this apparent paradox is both straightforward and crucial: married women are now far more likely to work. In 1970, half of all married-couple families had only male breadwinners. By 2000, this group had shrunk to one quarter (see figure 2). In 1970, one-third of all married-couple families had two wage-earners, but three-fifths did in 2000. In fact, two-earner families are more common today than male-breadwinner families were 30 years ago.

Each type of family is also working a little more each week, but this change is relatively modest and certainly not large enough to account for the larger shift in total household working time. Two-earner families put in close to 82 working hours in 2000 compared with 78 hours in 1970. Male-breadwinner couples worked 44 hours on average in 1970 and 45 hours in 2000. The vast majority of the change in working time over the past 30 years can thus be traced to changes in the kinds of

families we live in rather than to changes in how much we work. Two-earner couples work about as much today as they did 30 years ago, but there are many more of them because more wives are working.

Single parents, who are overwhelmingly mothers, are another group who are truly caught in a time squeeze. They need to work as much as possible to support their family, and they are less likely to be able to count on a partner's help in meeting their children's daily needs. Although these households are not displayed in figure 2, Census Bureau data show that women headed one-fifth of all families in 2000, twice the share of female-headed households in 1970. Even though their average work week remained unchanged at 39 hours, the lack of childcare and other support services leaves them facing time squeezes at least as sharp. Single fathers remain a much smaller group, but their ranks have also grown rapidly. Single dads work almost as much as single moms—37 hours per week in 2000. Even though this represents a drop of two hours since 1970, single fathers face time dilemmas as great as those facing single mothers. Being a single parent has always posed daunting challenges, and now there are more mothers and fathers than ever in this situation.

At the heart of these shifts is American families' growing reliance on a woman's earnings—whether or not they depend

figure 3: average hours of work per week of couples (parents and non-parents)

Source: March Current Population Surveys; nonfarm married couples aged 18-64

on a man's earnings as well. Women's strengthened commitment to paid employment has provided more economic resources to families and given couples more options for sharing the tasks of breadwinning and caretaking. Yet this revolution in women's work has not been complemented by an equal growth in the amount of time men spend away from the job or in the availability of organized childcare. This limited change at the workplace and in men's lives has intensified the time pressures facing women.

dual-earner parents and working time

The expansion of working time is especially important for families with children, where work and family demands are most likely to conflict. Indeed, there is a persisting concern that in their desire for paid work, families with two earners are shortchanging their children in time and attention. A closer look reveals that even though parents face increased time pressure, they cope with these dilemmas by cutting back on their combined joint working time when they have children at home. For example, U.S. Census data show that parents in two-income families worked 3.3 fewer hours per week than spouses in two-income families without children,

a slightly wider difference than the 2.6 hours separating them in 1970. Working hours also decline as the number of children increase. Couples with one child under 18 jointly averaged 81 hours per week in 2000, while couples with three or more children averaged 78 hours. Rather than forsaking their children, employed parents are taking steps to adjust their work schedules to make more time for the rest of life.

However, it is mothers, not fathers, who are cutting back. Fathers actually work more hours when they have children at home, and their working hours increase with the number of children. Thus, the drop in joint working time among couples with children reflects less working time among mothers. Figure 3 shows that in 2000, mothers worked almost 4 fewer hours per week than married women without children. This gap is not substantially different than in 1970.

This pattern of mothers reducing their hours while fathers increase them creates a larger gender gap in work participation among couples with children compared to the gender gap for childless couples. However, these differences are much smaller than the once predominant pattern in which many women stopped working for pay altogether when they bore children. While the transition to raising children continues to

A school district superintendent works at home. He spends 50 to 60 hours a week at his office, over an hour commuting each day, and like many professionals, another 5 to 10 hours a week working at home. The long hours are easier to manage now that his children have grown up and left home.

have different consequences for women and men, the size of this difference is diminishing.

It is also important to remember that the rise in working time among couples is not concentrated among those with children at home. Though Americans continue to worry about the consequences for children when both parents go to work, the move toward more work involvement does not reflect neglect on the part of either mothers or fathers. On the contrary, employed mothers continue to spend less time at the workplace than their childless peers, while employed fathers today do not spend substantially more time at work than men who are not fathers.

solving the time pressure puzzle

Even though changes in the average working time of American workers are modest, many American families have good reason to feel overworked and time-deprived. The last several decades have witnessed the emergence of a group of workers who face very long work weeks and live in families that depend on either two incomes or one parent. And while parents are putting in less time at work than their peers without children at home, they shoulder domestic responsibilities

that leave them facing clashes between work demands and family needs.

The future of family well-being and gender equality will depend on developing policies to help workers resolve the time pressures created by the widespread and deeply rooted social changes discussed above. The first step toward developing effective policy responses requires accepting the social transformations that sent women into the workplace and left Americans wishing for a balance between work and family that is difficult to achieve. Unfortunately, these changes in the lives of women and men continue to evoke ambivalence.

For example, mothers continue to face strong pressures to devote intensive time and attention to child rearing. Indeed, generally they want to, despite the rising economic and social pressure to hold a paid job as well. Even though most contemporary mothers are counted on to help support their families financially, the United States has yet to develop the child care services and flexible jobs that can help workers meet their families' needs. Whether or not mothers work outside the home, they face conflicting expectations that are difficult to meet. These social contradictions can be seen in the political push to require poor, single mothers to work at a paid job while middle-class mothers continue to be chastised for spending too much time on their jobs and away from home.

Photo by Danee Voorhees

This 19-year-old, single mother works long hours in an all-night restaurant. To secure care for her infant daughter, she shuttles the child back and forth between her parents' home and that of the father's parents. Women headed one-fifth of all families in 2000, twice the proportion in 1970, but the difficulties of raising children alone have largely remained the same.

To a lesser but still important extent, fathers also face intensifying and competing pressures. Despite American families' increasing reliance on women's earnings, men face significant barriers to family involvement. Resistance from employers and co-workers continues to greet individual fathers who would like to spend less time at work to care for their children. For all the concern and attention focused on employed mothers, social policies that would help bring men more fully into the work of parenting get limited notice or support. New time squeezes can thus be better understood by comparing the large changes in women's lives with the relative lack of changes in the situation for men. The family time bind is an unbalanced one.

Even as family time has become squeezed, workers are also contending with changes in the options and expectations they face at work. Competitive workplaces appear to be creating rising pressures for some workers, especially professionals and managers, to devote an excessive amount of time to their jobs, while not offering enough work to others. In contrast to these bifurcating options, American workers increasingly express a desire to balance the important work of earning a living and caring for a new generation.

Finding solutions to these new time dilemmas will depend on developing large scale policies that recognize and address the new needs of 21st century workers and their families. As we suggest in our book, *The Time Divide*, these policies need to address the basic organization of American work and com-

munity institutions. This includes revising regulations on hours of work and providing benefit protections to more workers, moving toward the norm of a shorter work week, creating more family-supportive workplaces that offer both job flexibility and protections for employed parents, and developing a wider array of high quality, affordable child care options.

Extending protections, such as proportional benefits and overtime pay, to workers in a wider range of jobs and occupations would reduce the built-in incentives employers have to extract as much work as possible from professionals and managers while offering less work to other employees. If professionals and managers were given overtime pay for overtime work, which wage workers are now guaranteed under the Fair Labor Standards Act, the pressures on these employees to put in endless workdays might lessen. Yet, the Bush administration recently revised these rules to move more employees into the category of those ineligible for overtime pay. Similarly, if part-time workers were offered fringe benefits proportional to the hours they work (such as partial pensions), there would be fewer reasons for employers to create jobs with work weeks so short that they do not provide the economic security all families need.

Reducing the average work week to 35 hours would also reduce the pressures on workers and help them find a better work-family balance. While this goal may seem utopian, it is important to remember that the 40-hour standard also seemed unimaginably idealistic before it was adopted in the early 20th century. Other countries, most notably France, have adopted this standard without sacrificing economic well-being. A shorter work week still would allow for variation in work styles and commitments, but it would also create a new cultural standard that better reflects the needs and aspirations of most contemporary workers. It would also help single parents meet their dual obligations and allow couples to fashion greater equality in their work and caretaking responsibilities.

Time at work is clearly important, but it is not the whole story. The organization of the workplace and the structure of jobs also matters, especially for those whose jobs and occupations require intensive time at work. Among those putting in very long work weeks, we find that having job flexibility and autonomy help ease the perceived strains and conflicts. The work environment, especially in the form of support from supervisors and co-workers, also makes a difference. In addition, we find that workers with access to such family-friendly options as flexible work schedules are likely to use them, while workers without such benefits would like to have them.

Flexibility and autonomy are only useful if workers feel able to use them. Women and men both express concern that making use of "family-friendly" policies, such as extended

A parent entrusts his child to a preschool director before heading off to work. The director now works more than 40 hours a week, but when her own children were young she worked part-time. Even that can seem too long when both members of a couple are working and parenting.

parental leaves or nonstandard working hours, may endanger their future work prospects. Social policies need to protect the rights of workers to be involved parents without incurring excessive penalties at the workplace. Most Americans spend a portion of their work lives simultaneously immersed in work for pay and in parenting. Providing greater flexibility at the workplace will help workers develop both short- and longer-term strategies for integrating work and family life. However, even basic changes in the organization of work will not suffice to meet the needs of 21st century families. We also need to join the ranks of virtually all other industrialized nations by creating widely available, high quality and affordable child care. In a world where mothers and fathers are at the workplace to stay, we need an expanded network of support to care for the next generation of workers.

These changes will not be easy to achieve. But in one form or another, they have been effectively adopted in other societies throughout the modern world. While no one policy is a cure-all, taken together they offer a comprehensive approach for creating genuine resolutions to the time pressures that confront growing numbers of American workers and their families. Ultimately, these new time dilemmas cannot be resolved by chastising workers (and, most often, mothers) for working too much. Rather, the time has come to create more flexible, family-supportive, and gender-equal workplaces and communities that complement the 21st century forms of work and family life. ■
